Post-processing: Minimum Match 0% Listing first 45 summaries

Database: n-geneseq30

Statistics: Mean 8.112; Variance 4.715; scale 1.720

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The 1gG1, in its nascent form, bears no sillyl-Lex side chains. The 1gG1, in its nascent form, bears no sillyl-Lex side chains. The Inventors designed a molecule including several such sites for additional Nelinked glycosylation sites are introduced at locations which impair complement fixing and Foreceptor binding ability. They are preferably located in the CH2 region of the Ig molecule. Antibodies bearing multiple sialyl-Lex determinants are useful for disrupting undesirable interactions between cells or proteins. Disrupting this interaction has therapeutic applications, for
                                                                                                                                                                                                                                                                              23-NOV-1990; US-618314.

The DNA (289329) and corresp. amino acid (R72070) sequences of the VH region of a representative clone, OF7H1.2, are provided.

The human placettal genomic DNA library cloned into the phage vector lambda FIX II was screened with the human VH1 family specific oligonucleotide (see 022418). Phage clone lambda segment VH49 R subcloned into pNNn3 to generate plasmid pVH40.8 An 800 bp region of this insert was sequenced. VH49.8 was found to have an open reading frame and intact splicing and recombination See also Q23419.49, Q22417-30.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 12: Page 96: 196pp; English. A human placental genomic DNA library cloned into the phage vector lambda FIX II was screened with the human VH1 family specific cligonuclectide Q44184 Phage clone lambda 49 % was isolated and a firk XBH1 fragment Containing the variable segment VH49 % was buckloned into pNNO3 to generate plasmid pVH49. % An #00bp region of this insert was sequenced (Q44185) and VH49.8 found to shave an open reading frame and inteat splining and recombination signals, indicating that the gene is functional.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Transgenic non-human animals contg. immunodiobulin heavy chain trans gene - used to produce useful antibodies by isotype

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is the variable heavy chain gene segment containing human DNA fragment, vA49.8, which was injected into half day mouse transgene. The resulting transgenic mice can be used for minilocus transgene. The resulting transgenic mice can be used for the production of heterologus (i.e. human) antibodies against specific antiqens, this comprises immunising a mouse with a preselected antiqen and collecting antigen binding heterologous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pred No 6 08e-149,

lymphocyte; hepatitis A virus; HAV; sero; positive; patient;
murine, B5B3; polyadenylated, cDNA library, human, kappa, L. H. ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   L- and H-chain DNA was amplified by PCR from Graves' orbital tissue and clones encoding autoimmune-associated immunoglobulin fragments were obtained. 13/15 clones of H chain (1gG1) genes showed homology to the closest germline genes, DP10 (Q8932) and HV1263 (Q89328). The DNA (Q89329) and corresp. amino acid (R72070) sequences of the VH region of a representative clone, OF7H1.2, are provided.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human monoclonal antibodies specific for the glyco:protein II sub:unit of varicella zoster virus - used in a therapy and prophylaxis of infection.

Claim 14: Fig 4B: 39pp: English.

A human anti-Varicella zoster virus monoclonal antibody was prepd.

A human anti-Varicella zoster virus monoclonal antibody was prepd.

Using the ricma method of Ostberg et al. (1983) Hybridoma 2:361-367.

One resultant trioma neutralised VZV in the absence of complement. This cell line, designated cell line IC98RA9, produced an antibody designated 93RA9. cDNA for the light and heavy chain variable region genes of the V3RA9 antibody were cloned using PCP. At least two heavy chain (gamma-1) and two light chain (kappa) specific clones were sequenced (see 082TA) & 082T50 respectively).

Antibody D is closely related in nature to mutine antibody BBB. Total RNA was isolated from antibody D expressing cells and polyadenylated RNA was extracted. These polyA RNA's were used to prepare a cDNA library which was screened for human Further heavy (H) chains and two positive clones were detected. Sequence 1617 BP; 375 A; 526 C; 441 G; 275 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 106 gcagtetgggggetgaagtaaagaageetggggteeteggtgaeggteetgeaaggeaa 165

This nucleotide sequence codes for the heavy chain variable region (VEA) (W19881) of human carcinoembryonic antigom (NEEA-specific antibody CEA6. VH (T72126-32) and VL (T72133-35) gene sequences were determined for anti-NCEA antibodies CEA1-CEA7 (see W19876-85) that had been obtained by selection from a universal phage display library. A claimed specific binding member (A) comprises an hCEA specific antibody antigen binding domain that has a dissociation constant for hCEA of less than 1 x 10 = M x, is non-cross-reactive with human liver cells, and preferentially binds to the A3-B3 extracellular domain of hCEA and/or to cell-associated hCEA over Soluble hCEA. Preferred (A) include pairings of VH and VL sequences from CEA1-7, or their CDR sequences, as well as CEA6 or visual or variants. (A) is used to detect cells expressing hCEA, in vitro, especially tumour cells for diagnosing cancer, sequence 369 BP; 85 A; 101 C; 109 G; 74 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        136 gagtggatgggaagtatcatccttcctttggtacagcaaactacgctcagaagttccag 195

Example 1: Page 81: 125pp: English.

T15:02 and T15:03 are the heavy and light chain variable domains of a human anti-tenust toxoid immunoglobulin (1g) encoded by a Pcomb3 based expression vector. The heavy and light chain variable domains of are used in an example to demonstrate the prodn. of antibodies for an antibody library using mutagenic primers. Mutagenic primers of the invention have sequences at their 3' and 5' ends both capable of binding different framework regions linked by a sequence 6 to 50 to incleotides long. Different immunoglobulins produced using the recover immunospecificities and affinities. By using mutagenic 0'Ns and covel immunospecificities and affinities. By using mutagenic 0'Ns and covel immunospecificities and affinities. By using mutagenic 0'Ns and covel immunospecificities and affinities. By using mutagenic 0'Ns and covel immunospecificities and affinities. By using mutagenic 0'Ns and covel immunospecificities and affinities. By using mutagenic 0'Ns and cover immunospecificities and affinities. By using mutagenic 0'Ns and conditions which yield functional heterodimeric antibodies.

HIV-Induced disease

Trample 1: Page 185-188: 249pp; English.

This sequence represents the prombly phagemid expression vector. This concern has been designed to allow for anchoring of expressed proteins on the bacteriophage coat protein. Gene III of filamentous phage encodes the date feriophage coat protein, cplil of filamentous phage encodes the date feriophage coat protein, cplil of filamentous phage encodes the date of the date of the date of the inner membrane facing into the periplasm of E. Coli. This plasmid was used within the scope of the invention to express on an accumulates on the inner membrane facing into the periplasm of E. Coli. This plasmid was used within the scope of the invention to express of various mutagenised human Fab's which comprise heavy and light variable regions which bind to HIV gpl20. Prombs allows for bethe cloning of and soluble forms of the Fabs. The vector was designed for the cloning two cassettes to express one fusion protein, Fd/cp3, and one soluble protein, the light chain. The finished vector comprises, operatively linked 5' to 3', a first cassette consisting of lac2 promoter/operator sequences, a spacer region, a cloning region bordered by 5' Xhol and C. 3' Spel restriction sites, the tether sequence, the sequences encoding between the two cassettes, and a stop codon, a NHeI restriction sites, obtaven the two cassettes, and a stop codon, a NHeI restriction sites, collowed by an expression control RBS, a PelB leader, a spacer region, a cloning region bordered by expression control RBS, a PelB leader, a spacer region, a cloning restriction sites, and a second lac2 promoter/operator sequence. Collowed by an expression control RBS, a PelB leader, a spacer region, a cloning restriction sites, the pund may a second lac2 promoter forms the basis construct of the way as a second lac2 promoter forms the basis construct of the way as a second lac2 promoter forms the basis construct. The way may real and a second lac2 promoter page.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                of the MT4 Fab display phagemid expression vector, pWT4-3 (see also 092540), used in the invention for the production of synthetic human Fab antibodies against gpl20 of HTV 1171 C, 1232 G; 1118 T; sequence 4691 BP; 1170 A; 1171 C, 1232 G; 1118 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Match 58.6%; Score 218; DB 16, Length 4691, Local Similarity 88.1%; Pred No 1 720-134, les 252; Conservative 0; Mismatches 34; Indels 0; daps 0;

Example 4. Feel 1971. 248-FF. Bullibria.

Example 4. Feel 2017. 248-FF. Bullibria.

CC modified version of the phagemid expression vector, pComb3 given in C92546. pPhorTI provides for the expression vector, pComb3 given in C92546. pPhorTI provides for the expression vector, pComb3 given in C92546. pPhorTI provides for the expression vector, pComb1 are secreted into the periplasmic space which is regulated from the alkaline phosphatase (phoA) promoter. This plasmid was used within the scope of the invention to express various mutanenised human Fab's which comprise the above and light variable regions which bind to HV ggl20. pphorII consists of a DNA molecule having two cassettes to express two soluble promoter/operator sequences, an Erst cassette consisting of the phoA copratively linked 5′ to 3′, a first cassette consisting of the phoA copromoter/operator sequences, an Erst restriction site, a ribosome binding site (R&S), an ompA leader, a Sil restriction site, a spacer of region, a cloning region bordered by 5′ scal and 3′ xbal restriction sites, and second cassette consisting of an expression control RBS, a PelB leader, a human consisting of an expression control Stop sequence Evol.LE.

Consensus amno terminus specer region comprising the sequence Evol.LE.

C consensus amno terminus specer region comprising the sequence Evol.LE.

C consistinction site, The phorIT expression control stop sequences and a NotI restriction site. In the phorIT expression workers of the heavy chain stuffer that is 1200 bp in length and a heavy chain stuffer that control stop sequences of the heavy and light chains to the phoreson the phoreson vector contains a light chain stuffer that is 1200 bp in length and a heavy chain stuffer that control stop sequences of the heavy and light chains to the province of a phoreson of a permine to the province of a phoreson of a permine to the province of the heavy and light control to the province of the phoreson of a perminent province of the phoreson of a perminent province of the province of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Indels 0; Gaps 0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   5354 ctcgagcagtctggggctgaggtgaagaagnortaggronicggigaaggicicicnigcagg 5413

production of manna immunostopouting in mannation modes.

A series of genes (078939-79002) encoding human immunoglobulin variable heavy chains. The genes were isolated and cloned from a series of cosmid constructs. Y202, Y103; Y21; Y5;Y24; 3-31; M44; M118 and M131, by PCR amplification using primers Q78917-38. The genes are subdivided into 5 fragments were isolated from high molecular weight DNA from human placenta. The DNA was partially digested with Tagl restriction enzyme. The fragments were separated by gel electophoresis and 35-45 kb fractions were collected. The fragments were ligated with Clai-digested cosmid vector pJ881. The ligation products were in vitro packed and infected into E.coli 490A. The fragments were then subcloned by colony colony human immunostobulin in mammalian hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Match 54.8%; Score 204; DB 13; Length 539; Local Similarity 85.4%; Prod. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed.

Mean 9,946; Variance 4 184; scale 2,377

Statistics:

and is derived by analysis of the total storm distribution.
